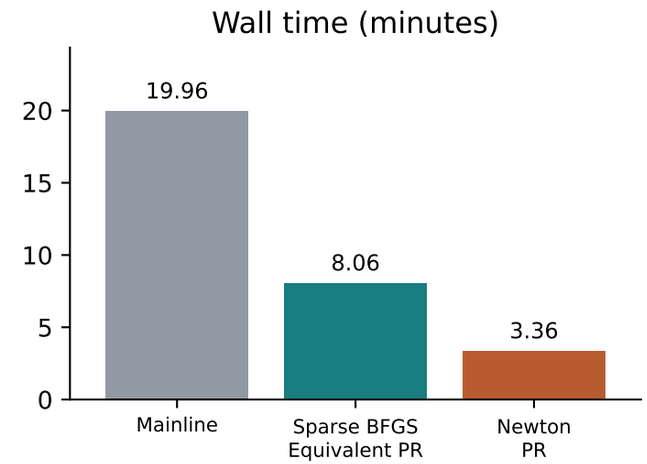
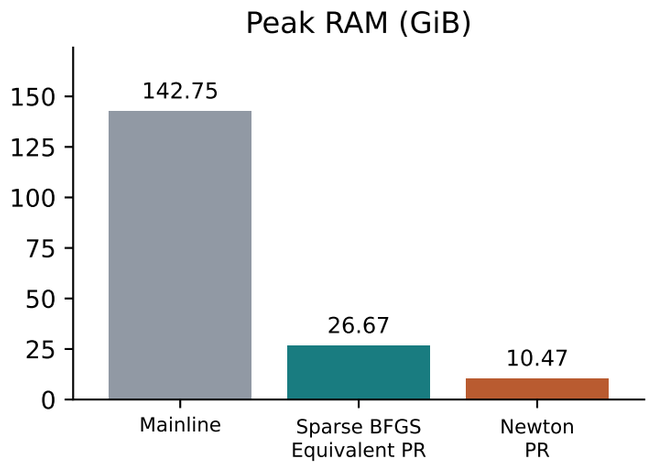
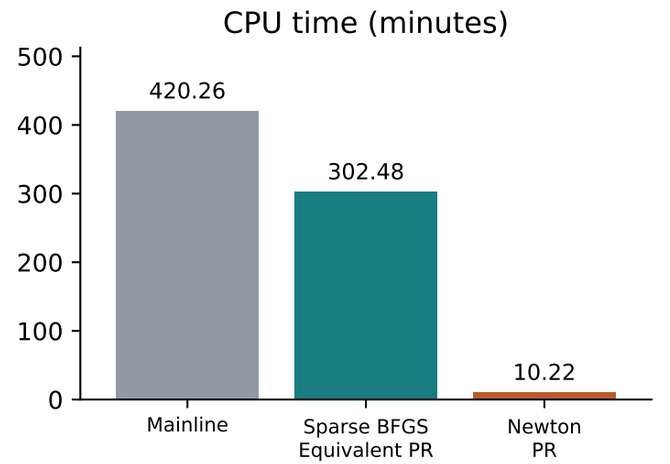
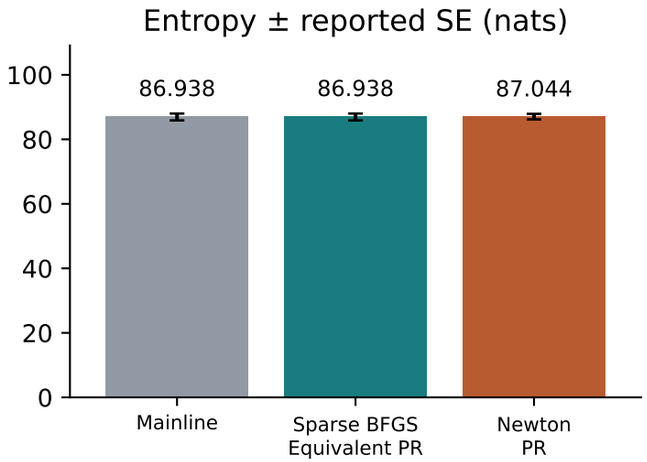
PDZ: Newton vs equivalent-performance and BFGS
101 residues × 10,500 frames; K=100, seed 0

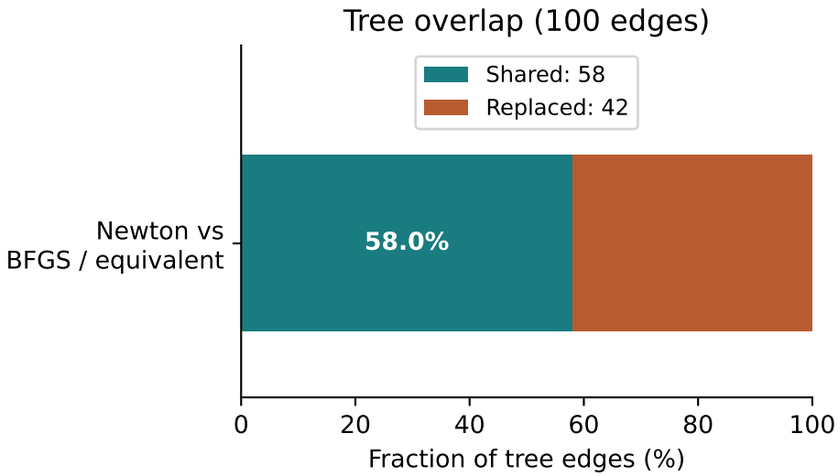
BFGS reference: unmodified mainline. Equivalent PR preserves its audited scientific outputs.

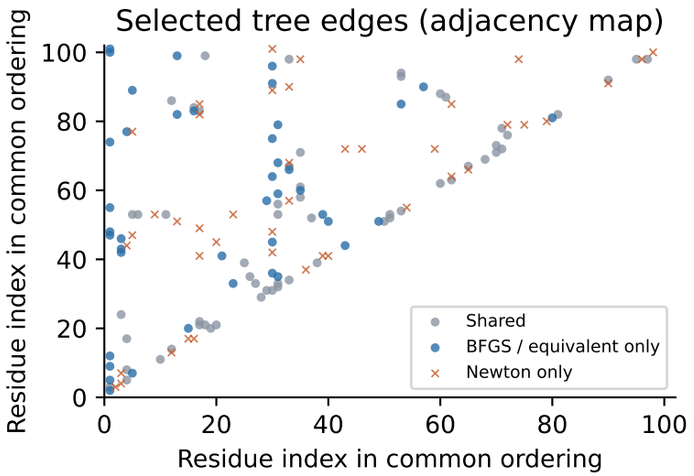












Benchmarks: compression disabled (--hdf5_compression none). Default output: lossless gzip-1 + shuffle.
Single runs with hardware/thread/allocation differences; whole-configuration observations, not isolated solver speedups.
Tree diagrams show residue-index adjacency, not spatial contacts. Error bars are reported entropy SE, not timing variability.
PDZ Newton resource measurement is the final block-export composition on A089; BFGS/equivalent ran on different nodes.
